Intermediate Accounting I, Competing in the Global Market Place, Sixth Edition, Charles W.L. Hill, McGraw-Hill, 2005, TB 535Q: Obfuscated Language This question refers to the MSDN page for XOR Encryption operator. Why are some of the properties obfuscated? Is there any possibility that they could be exposed? I'm assuming the answer is yes. That seems like a common problem for obfuscated programming languages. Thanks! A: They're obfuscated when the editor is displaying metadata about them. XOR is "obfuscated" because it's a template; the template simply doesn't care if it's using a String, an XmlElement, or anything else. It "obfuscates" the template by showing the outside, not the inside. So, in the example you provided, "Encryption" is a template; no one knows what's really going on inside. Using reflection, you could recover the template name and know how to use it. (Basically, the template "itself" is the client-code pattern; the template can use anything that's available to the template.) Then, in the example you posted, "Compute" is a template; again, no one really knows what is going on inside it. The inside is a freeform string; the outside is a String. Using reflection you could see that the inside is a string, but not see what kind of string it is or where it came from. A lot of times, obfuscation is just a way to confuse, because once you know how it really works, it doesn't work any more (because it's no longer obfuscated). Others are used so a "clueless user" isn't able to figure out how to use it, as in the case of XOR. Tony Lamord Tony Lamord was a jazz musician. He played tenor saxophone and clarinet. He is the father of bassist Mitch Lamord. Selected discography "Rhythm Mates" (Muse, 1993) References Category:American jazz saxophonists Category:American male saxophonists Category:American jazz clarinetists Category:American jazz musicians Category:Living people Category:21st-century saxophonists Category:21st-century clarinetists Category
